

配置相关

操作系统: CentOS7

docker容器: node1, node2, node3

Zookeeper: node1 (Follower), node2 (Follower), node3 (Leader)

Kafka: node1, node2, node3

Flink: node1 (TaskExecutor), node2 (Standalonesession, TaskExecutor), node3 (TaskExecutor)

keys: root:123123

测试步骤

1. 分别导入三个Docker容器:

```
docker import node1.ova docker-node1:node1
```

```
docker import node2.ova docker-node2:node2
```

```
docker import node3.ova docker-node3:node3
```

2. 分别启动三个容器

```
docker run -it docker-node1:node1 /bin/bash
```

```
docker run -it docker-node2:node2 /bin/bash
```

```
docker run -it docker-node3:node3 /bin/bash
```

3. 分别在三个容器中启动Zookeeper、Kafka

```
su root
systemctl stop firewalld
zkServer.sh start
kafka-server-start.sh config/server.properties
```

4. 创建topic: weibo、flinkresult

```
kafka-topics.sh --bootstrap-server node1:9092,node2:9092,node3:9092 --partition 3 --
topic weibo
kafka-topics.sh --bootstrap-server node1:9092,node2:9092,node3:9092 --partition 3 --
topic flinkresult
```

5. 在node1开启了一个weibo (topic)的consumer用于观察流式数据的输入(new terminal)

```
kafka-console-consumer.sh --bootstrap-server node1:9092,node2:9092,node3:9092 --topic
weibo
```

6. 在node3开启了一个flinkresult (topic)的consumer用于观察Flink输出结果(new terminal)

```
kafka-console-consumer.sh --bootstrap-server node1:9092,node2:9092,node3:9092 --topic
flinkresult
```

7. 在node2中启动flink

```
start-cluster.sh
```

8. 进入Flink Web UI: localhost:8081 --> submit new job --> Add new --> 选择jar包 --> submit

9. 在主机端解压kafkaProducer.zip, 指定kafkaProducer.java中的filePath为data_test.csv路径, 并运行该Java项目用于模拟流式数据, 并作为Kafka Producer向weibo topic中发送数据

10. 在node3中观察输出结果 (flinkresult topic)

其他

docker镜像是用VMware虚拟机上导出的ova文件创建的, 在部署时若有任何问题请联系我!
